# CIFAR-10 | Full-batch Adam

5,000 training images | tanh 200-200 MLP | First 2,000 updates

Momentum is bias-corrected: $\widehat{m}_t = m_t/(1-0.9^t)$. Cosines and $\eta\widehat{\kappa}$: 100-pair trailing means.

Loss, norms and norm ratio are unsmoothed. Norms and the ratio use log Y; other panels use linear Y.

Ordinary Hessian every 100 steps. $\eta\widehat{\kappa}$ is a gradient trajectory proxy along Adam.
