CIFAR-10 MLP: gradient alignment and output-change alignment

Unchanged Adam control | 353 paired states, 448-800 | Same t, no lag shift or smoothing

$$\rho_t = \cos(g_t, g_{t-1}), \qquad \rho_t^{(\Delta F)} = \cos(F_{t+1} - F_t,\ F_t - F_{t-1})$$

F concatenates all 10 raw outputs for all 5,000 examples. Correlation is descriptive for this dependent time series.
