CIFAR-10 MLP: loss, temporal alignment and network outputs

Unchanged Adam control | States 448-800 | 10 output dimensions, averaged across all 5,000 examples

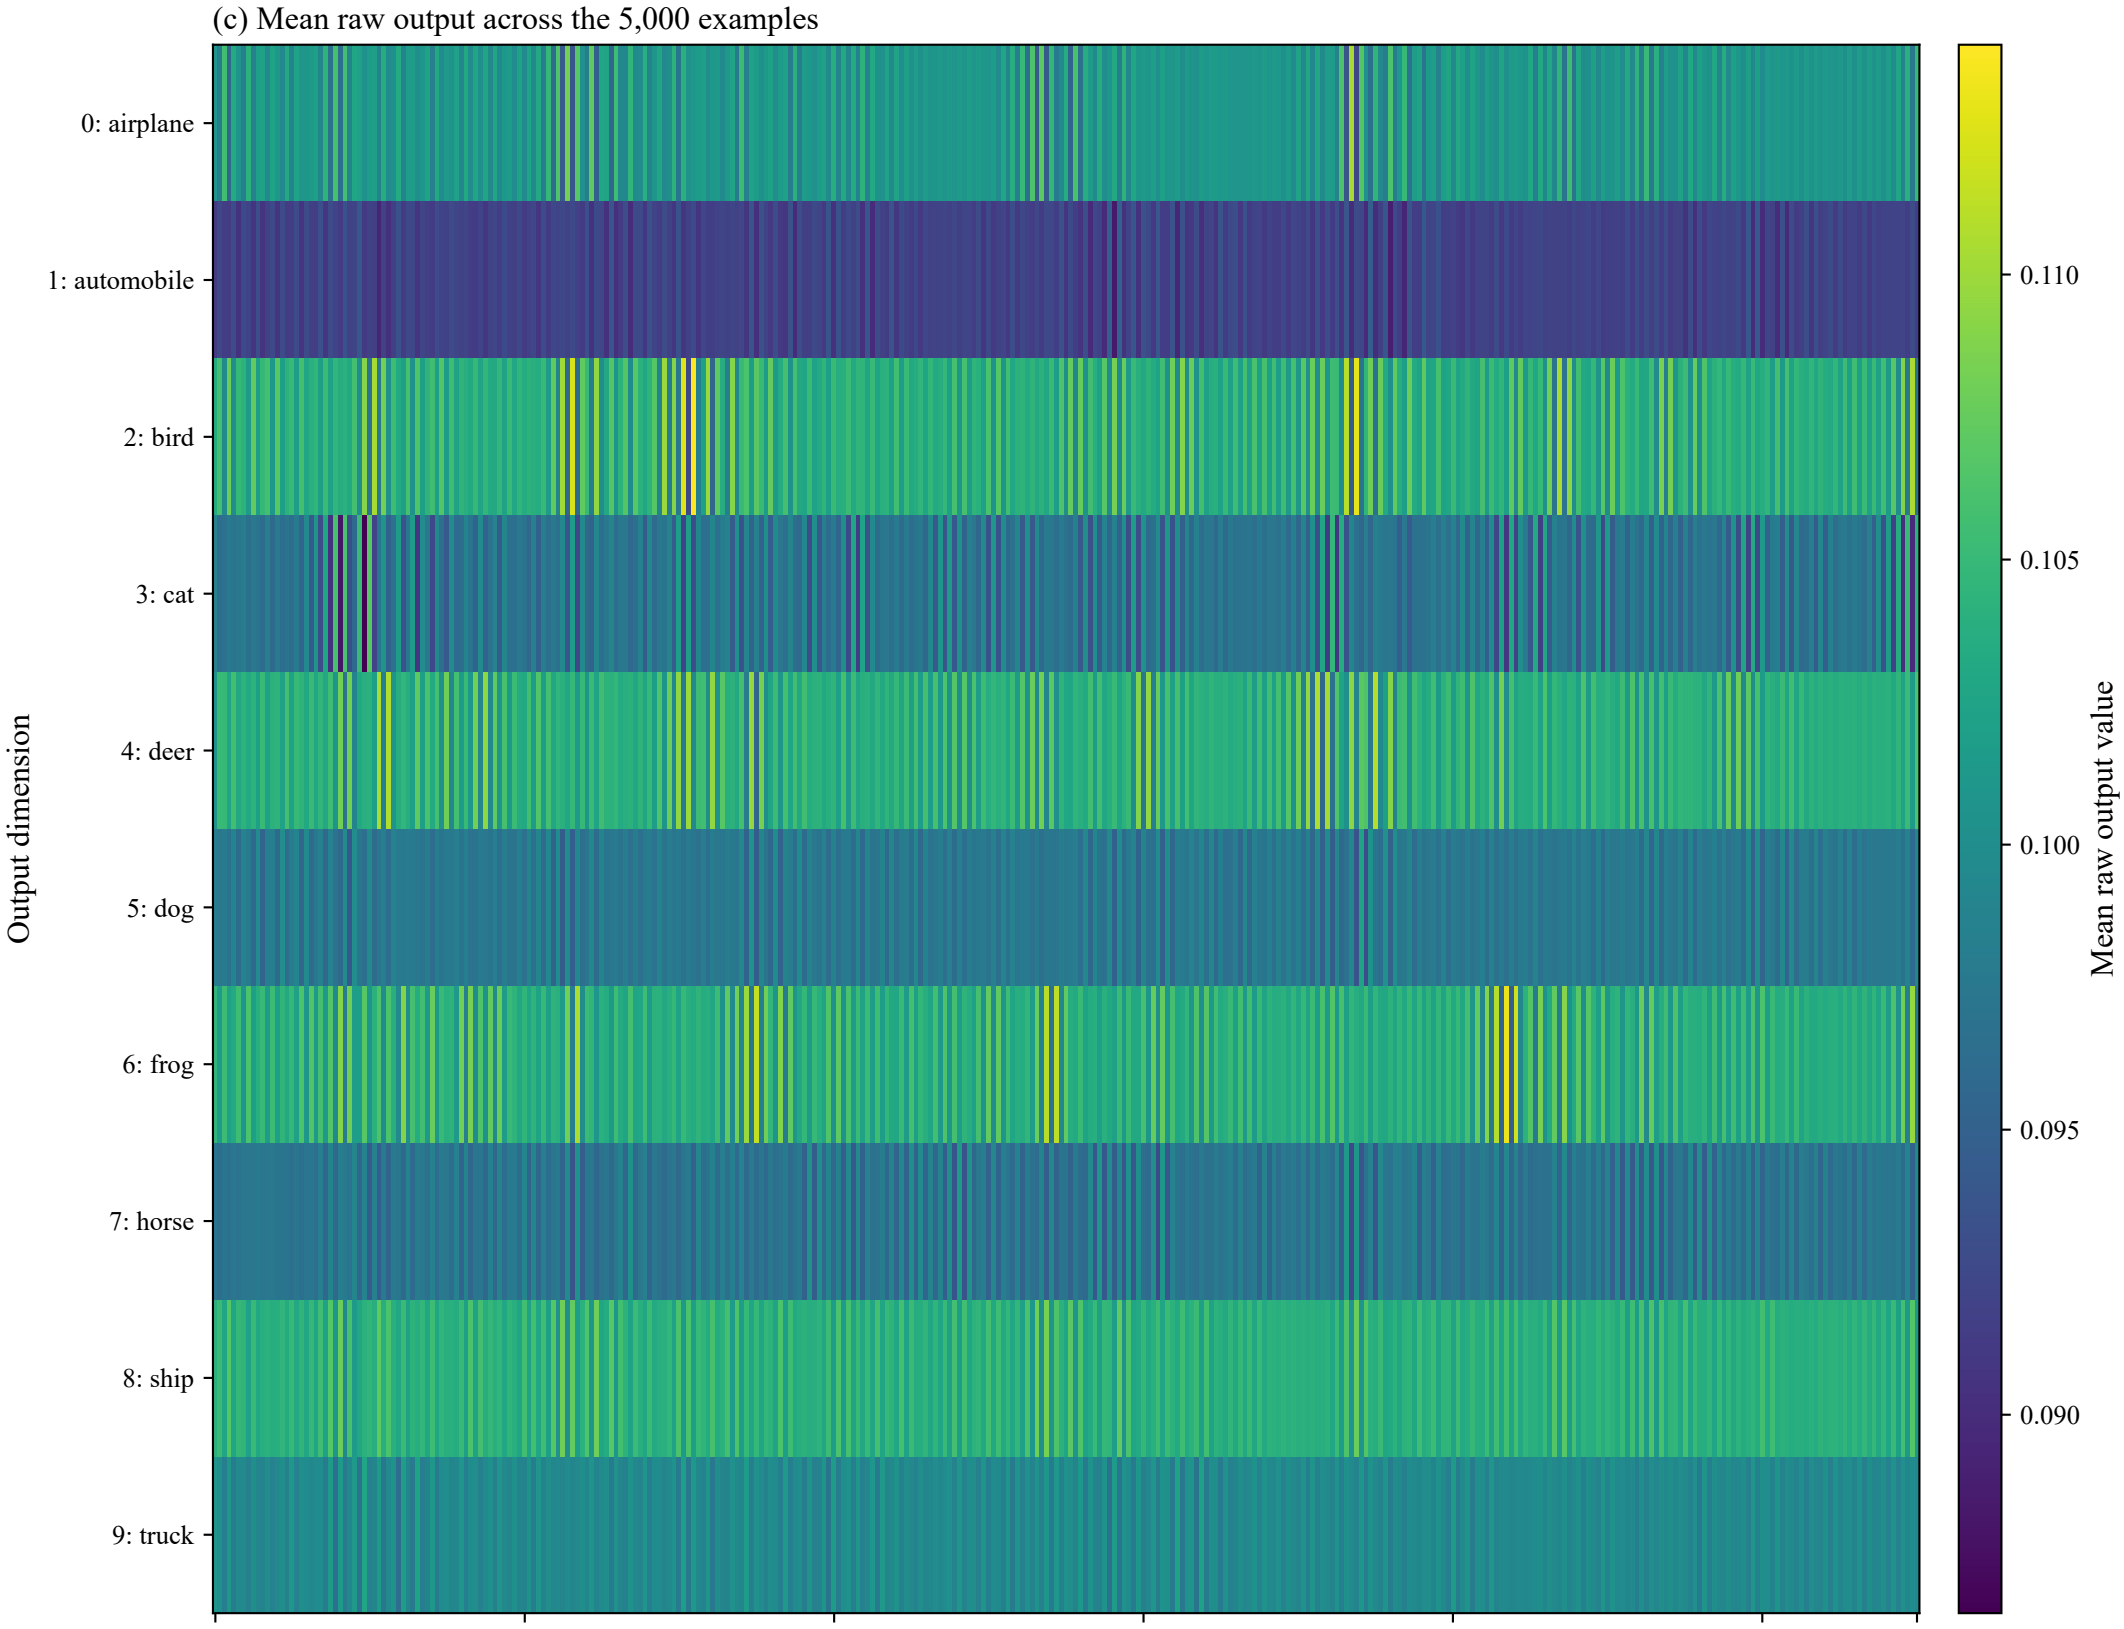

(a) Full training loss

(b) Temporal alignment overlay

(c) Mean raw output across the 5,000 examples

$\rho_t = \cos(g_t, g_{t-1}), \quad \rho_t^{(\Delta F)} = \cos(F_{t+1} - F_t, F_t - F_{t-1})$

Arithmetic mean across all5000 fixed examples, separately per output coordinate and state. No value clipping or row normalization.
