

Mod-31 Transformer | 10 paired seeds | AdamW, $\eta = 10^{-3}$ | thin: seeds; thick: median.
Loss / proxy: 100-state / 100-pair means (last proxy bin: 99); loss dots: final state. Proxy axis: symmetric log.
Hessian panels: 23 measured states, all 480 train pairs, common FP64 evaluator. $\widehat{\kappa}$ is an AdamW trajectory proxy, not a Hessian estimate.
